

Lab-3 Ex1 - Time Formatting (PreLab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and before you come to lab!

Your classmate yelled: "I have used 4531 seconds to finish all the lab exercises!"

How long is that exactly?! Let's find that out by writing a C program to convert a non-negative integer input, ***in seconds***, to standard ***time format***.

The standard format is:

H Hours M Minutes S Seconds

You are recommended to first read the following pseudocode:

```
Get input x from user
```

```
Hours = x / 3600 // every hour has 60 x 60 seconds
```

```
Remainder = x % 3600 // this gives us the minutes and seconds total
```

```
Minutes = Remainder / 60 // every minute has 60 seconds
```

```
Seconds = Remainder % 60
```

```
print Hours, Minutes, Seconds in specified format
```

Do you understand the formula above? Try to **calculate/dry-run** the above with the input **4531** and you will be very clear. Assume all input are valid.

Don't forget to declare necessary variables with the appropriate data type.

Sample Run #1 (user input is bolded and in italic)

4531

1 Hours 15 Minutes 31 Seconds

Sample Run #2 (user input is bolded and in italic)

3600

1 Hours 0 Minutes 0 Seconds

Sample Run #3 (user input is bolded and in italic)

65

0 Hours 1 Minutes 5 Seconds

** We understand that "1 Minutes" is bad English, but let's keep our program simple and accept this for now!*
