

Lab-4 Ex2 - Lucky Draw Lookup (PreLab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and before you come to lab!

Below you will find a C program that asks the user for a number from 1 to 100 and replies whether he/she has won the lucky draw!

```
1  #include <stdio.h>
2
3  int main(void) {
4      int prizeLookup[] =
5          {1,0,0,2,0,0,0,0,0,0,
6           0,0,0,0,0,0,0,0,0,0,
7           0,0,0,0,0,0,0,0,0,0,
8           1,0,0,0,0,0,0,0,0,0,
9           1,0,0,0,0,0,0,0,0,0,
10          // lookup table to be completed
11
12      };
13
14      int num;
15
16      printf("Draw no.? ");
17      scanf("%d", &num);
18      if (prizeLookup[num-1] == 2) {
19          printf("You won a top prize!");
20      }
21      // conditions to be completed
22
23      return 0;
24  }
```

In reality the numbers that lead to prizes is set to be:

- **Top prize:** Number 4
- **Consolation prizes:** Numbers 1, 31, 41, 61, 81, 98 and 100
- **No prize:** All other numbers

Please copy and complete the program so that it will function properly. You **MUST** not add other statements or rewrite the program. Assume input is always valid.

Do you understand the intention of using "num-1" as array index in the branching conditions?

User-input integers are ***bold and italic*** in the following sample runs.

Sample run #1:

Draw no.? **12**

No prize :(

Sample run #2:

Draw no.? **4**

You won a top prize!

Sample run #3:

Draw no.? **100**

You won a consolation prize!
