

Lab-5 Ex1 - Finite Repetition (Prelab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

In the lecture we have covered two basic cases for using looping in C. The easiest case is finite repetition, in which we are aware of a finite times that a loop will run.

In this C exercise, let's try to print letters from A to Z. Before you learn looping, of course you can print A to Z manually. But that is so unfashionable! Let's use a loop to achieve that!

Please follow this **pseudocode** to complete the program:

```
define integer x = 0

define char c

while x < 26

c = 'A' + x // do you recall what is, say, ('A' + 1)?

print "letter <x+1> is <c>" // do you know why it's (x+1)?

x = x + 1

end of loop
```

The sample input/output follows:

Sample run (input is *bold and italic*):

```
letter 1 is A
letter 2 is B
letter 3 is C
letter 4 is D
letter 5 is E
letter 6 is F
letter 7 is G
letter 8 is H
letter 9 is I
letter 10 is J
letter 11 is K
letter 12 is L
letter 13 is M
letter 14 is N
letter 15 is O
letter 16 is P
letter 17 is Q
letter 18 is R
letter 19 is S
letter 20 is T
letter 21 is U
```

letter 22 is V
letter 23 is W
letter 24 is X
letter 25 is Y
letter 26 is Z

Please DO NOT print the 26 lines manually!
