

Lab-5 Ex4 - Integer Multiples

Write a C program to print integer multiples of **(n-1)** from 1000 to 1500, inclusively.

It shall begin with asking the user for an integer *n*, which is assumed to be **greater than 1** and valid. The program shall contain a while-loop which performs a divisibility test on all integers in the range. For example, if *n* is 21, 1000 should be printed out since it is divisible by (21-1), but 1001 should not be printed out.

Hint 1: You may want to use the modulus operator % and check the remainder result as a way to conduct divisibility test.

Hint 2: You can print a space after each printed number. As a result, there will be a space after the last printed number.

User-input integers are ***bold and italic*** in the following sample runs.

Sample run #1:

19

1008 1026 1044 1062 1080 1098 1116 1134 1152 1170 1188 1206 1224 1242
1260 1278 1296 1314 1332 1350 1368 1386 1404 1422 1440 1458 1476 1494
``

Sample run #2:

101

1000 1100 1200 1300 1400 1500 ``

Sample run #3:

800
