

Lab-7 Ex2 - Pattern Printer (Prelab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

Below you will find a piece of pseudocode that involves a nested loop:

```
print "Rows (2-20)? " and obtain a user integer input (assume valid)
declare integers i, j
for i = 0 to N-1
    // the dots on the left
    for j = 0 to N-i-2
        print "."
    end for
    // the tree
    for j = 0 to 2*i
        print "*"
    end for
    // the dots on the right
    for j = 0 to N-i-2
        print "."
    end for
    print "\n"
end for
```

Please be careful with the starting and end brackets of your for loops!

If you implement the pseudocode successfully, you will see the following sample outputs. Isn't it amazing?! Can you trace the program? Do you understand why it can print these beautiful patterns?

User-input numbers are ***bold and italic*** in the following sample runs.

Sample run #1:

Rows (2-20)? ***5***
