

Lab-10 Ex5 Palindrome

Write a C program to read input strings one by one and check whether each of them is a palindrome, which reads the same forward or backward, until the user enters "quit" (case-insensitive).

For each input string, you can assume that the user will enter at most 20 characters without any spaces.

Note that the checking is case-insensitive.

Sample Run #1

eye

Palindrome

Eye

Palindrome

university

Not palindrome

RaceCar

Palindrome

Quit

Bye

Sample Run #2

qUiT

Bye
