

Lab-11 Ex2 - Article

In the lecture, we have learned struct and string processing this week. Let's have a practice for both struct and string processing together.

Write a C program that:

1. Read the title, authors, journal and published year of an article
2. Create the Article struct holds all the above information
3. Print the Article using `print_format_full(Article)`
4. Print the Article using `print_format_simplified(Article)`

The input contains 4 lines of texts or numbers.

```
<title>
<authors>
<journal>
<published year>
```

You can assume `<title>`, `<authors>` and `<journal>` are strings with at most 80 characters. It can contain spaces.

`<published year>` is a number.

First, output the full format of the article, for example:

```
Title    : Problem Solving by Programming
Author   : ENGG1110 Team
Journal  : Programming Journal
Year     : 2020
```

Then, output the simplified format of the article, for example:

```
ENGG1110 Team. Problem Solving by Programming. Programming Journal (202
```

Sample run (input is ***bold and italic***):

Problem Solving by Programming

ENGG1110 Team

Programming Journal

2020

```
Title    : Problem Solving by Programming
Author   : ENGG1110 Team
Journal  : Programming Journal
Year     : 2020
```

```
ENGG1110 Team. Problem Solving by Programming. Programming Journal (202
```

Hint: Probably, you cannot use `scanf()` with `%s` in this exercise, due to the spaces included

in the input, so you need to use `fgets()` instead. Pay attention to the behavior of `fgets()` is that the ending newline `'\n'` character will also be captured into the input string as well. So, you have to remove this extra character before using.
