

Lab-13 Ex6 - Read File - Reverse Each Line

Write a C program that reverses the content of each line of `input.txt`, and prints the results with the number of characters read/printed.

- Open `input.txt` using read mode.
 - Read a line from `input.txt` to a character array `str`.
 - Set the newline character in `str` to 0.
 - Print the number of characters read to the console (followed by a whitespace).
 - Use a loop to print the content of `str` from the end to the front to the console.
 - Repeat the previous 3 steps until reaching the EOF.
 - Close all opened files. You can assume that one line does not contain more than 100 characters.
-

Sample run #1:

`input.txt`

ENGG1110

A/B/C/D

Console output:

8 0111GGNE

7 D/C/B/A
