

Lab-1 Ex1 - Hello World!

Creating a "Hello World" program is a tradition in all programming courses. Let's have your first Hello World program in C!

In the program template on the left, we have already defined the `main()` function for you. Please use the `printf()` function you have learned in the lecture to print "Hello ENGG1110!" to the output. If successful, your output should look like this:

```
Hello ENGG1110!
```

Please notice that in the world of programming, you often need to create programs that follow the specifications of a program in an *exact* manner. That means, you have to obey every single whitespace and letter case, e.g. *hello* is not the same as *Hello*.

In our lab exercises, please make sure letter case must be respected, and no typos are allowed!
