

Lab-1 Ex2 - Typing Out a Simple Program

As you have learned in lecture, most programming languages have very strict syntax. At the minimum level, your program cannot compile properly if it contains typos or symbols that it does not recognize.

Below you will find a simple C program. Despite the fact that you have just started learning C, you can clearly see this intuitive program allows you to calculate the perimeter and area of a circle after the user input a radius:

```
#include <stdio.h>

int main(void) {
    double radius;
    double pi = 3.14;

    printf("Input the radius: ");
    scanf("%lf", &radius);
    printf("Perimeter: %.2f\n", 2 * pi * radius);
    printf("Area: %.2f\n", pi * radius * radius);
    return 0;
}
```

Please type out the above program ***accurately*** and make sure that it functions properly. Notice that any typo may cause compilation error or mismatch in expected output, so please type carefully! You can enlarge the picture by dragging the handle in the middle of the screen, or right click on the picture and choose "Open image in new tab" on Chrome.

If you have typed in the program code correctly, it should show the following behavior:

Sample Run #1 (user input is bolded and in italic)

Input the radius: ***3***

Perimeter: 18.84

Area: 28.26

Sample Run #2 (user input is bolded and in italic)

Input the radius: ***1.5***

Perimeter: 9.42

Area: 7.06
