

Lab-12 Ex1 - Pointer Warmup (Prelab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

As we have discussed in lecture, pointers can be used to update multiple value via functions. Let's first warm up by creating some maths function in C!

In `main.c` you see a template with one empty function `getAreaVolume()`:

```
void getAreaVolume(int side, int *pArea, int *pVolume) {  
    // calculate and update the cube's surface area and volume  
    //                               via the passed pointers  
}
```

The function should calculate the surface area and volume of a cube, respectively. The function, `getAreaVolume()`, will take in one `int` parameter of `side` and two `int*` pointer parameters of `pArea` and `pVolume`.

Can you help finish this empty functions so that the C program can have the proper behavior, as shown below? Please do NOT touch the main function!

Assume all input are valid (`side > 0`). User-input numbers are ***bold and italic*** in the following sample runs.

Sample Run #1

Side of cube (cm)? ***1***

Surface Area: 6 cm²

Volume: 1 cm³

Sample Run #2

Side of cube (cm)? ***2***

Surface Area: 24 cm²

Volume: 8 cm³
