

Lab-13 Ex2 - Hidden Message!

Ungraded exercise means that this is not counted to the course total. However, we recommend you complete this as a revision of the final examination. Please be reminded that the final examination is a written examination. Writing a program on a piece of paper is different from typing code in a computer.

Hidden messages are to be discovered in user input! Can you write a program to extract these messages?

Write a C program to:

1. Read a non-empty string from the user
2. Print the input string reversed
3. Extract all letters ('a'-'z', 'A'-'Z') from the string also in reverse and print the hidden message!

It is possible that the hidden message is empty. A hint—you don't need to really reverse the string. You can loop from the end of string to the beginning instead!

You can assume that the user will only enter at most 20 characters without any spaces.

User input is ***bold and italic*** in the following sample runs.

Sample Run #1

o4l3l2e1h

h1e2l3l4o

hello

Note: In above the second line is the reverse of the first line, and the third line is the hidden message, produced by extracting the letters from second line

Sample Run #2

es\$\$re123veR5

5Rev321er\$\$se

Reverse

Sample Run #3

12345!!!451234512345

543215432154!!!54321

Note: There are no letters at all in the user input, so the final output message is empty.
