

Lab-2 Ex6 - Tutor Working Hours

In some longer exercises, we will ask you to fill in an academic honesty declaration along with your submitted program. On the left, you can see the template. Please fill in your name, student ID, class section and date in the appropriate locations in the template before you proceed with the exercises. Thank you for your co-operation.

You wish to create a simple program to calculate the average number of working hours for tutors in this course.

The input to your program is:

1. Total number of lab hours per week (an integer **h**)
2. Total number of weeks in the semester (an integer **w**)
3. Total number of tutors (an integer **t**)

For simplicity, let's assume there is exactly one tutor on-duty in lab at any time. The output of your program is the average number of hours the tutor will need to work for the whole semester.

Clearly the formula is very simple:

**** average working hours = (h * w) / t ****

Please make sure the program has the exact output as shown below. All decimals should be shown with 3 decimal places. Assume all input are valid inputs.

Sample Run #1 (user input is bolded and in italic):

Number of lab hours per week: **2**

Number of weeks this semester: **12**

Number of tutors: **5**

Average working hours = (2 * 12) / 5 = 4.800

Sample Run #2 (user input is bolded and in italic):

Number of lab hours per week: **1**

Number of weeks this semester: **10**

Number of tutors: **3**

Average working hours = (1 * 10) / 3 = 3.333
