

Lab-5 Ex2 - Indefinite Repetition (PreLab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

Little May is a cute little girl. She likes to ask adults around her to guess her age until they guess it correctly. Little May's age is 7.

User-input integers are ***bold and italic*** in the following sample runs.

Sample run #1:

Guess my age? ***10***

Guess my age? ***6***

Guess my age? ***7***

You got it!

Sample run #2:

Guess my age? ***7***

You got it!

You can follow the pseudocode below to finish this very simple program. According to our lecture notes, this is Basic Case #2, indefinite repetition. You can assume user input is always a positive integer

```
define guess = 0

while guess is not 7

    print "Guess my age? " and ask user for integer and assign it to
    guess

end of while

print "You got it!"
```

Note: Does it matter what value we set "guess" to be at the beginning?
