

Lab-5 Ex5 - Prime Numbers Lookup

Complete the given program to print **all prime numbers** in user input integer range `[start, end]`. We assume $2 \leq \text{start} \leq \text{end} \leq 100$ and no input validation is needed. After printing the prime(s), show also the number of primes printed.

Be reminded that you have completed a program to do a lucky draw lookup before in **Lab-4 Ex2**. You may find the program very helpful as reference.

You may realize we have already given you a lookup table `isPrime[]` in the `main.c` code. How can you use it to determine whether a number is prime or not?

User-input integers are ***bold and italic*** in the following sample runs.

Note: After the user input, the program should print `[start, end] prime1 prime2 ... primeN (N)` where N is the number of primes within the range.

Sample run #1:

2 100

```
[2, 100]: 2 3 5 7 11 13 17 19 23 29 31 37 41 43 47 53 59 61 67 71 73
79 83 89 97 (25)
```

Sample run #2:

35 36

```
[35, 36]: (0)
```

Sample run #3:

37 37

```
[37, 37]: 37 (1)
```
