

Lab-7 Ex1 - Little May Returns (Prelab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

Remember Little May who asked you to guess her age? This time, she will grant you a wish! You can tell her how many stars you want, and she will give you the STARS as gift! She will only stop when you want zero stars.

User-input numbers are ***bold and italic*** in the following sample runs.

Sample run #1

How many stars do you want? ***6***

How many stars do you want? ***7***

How many stars do you want? ***100***

How many stars do you want? ***0***

Sample run #2

How many stars do you want? ***10***

How many stars do you want? ***0***

You can finish the program with the following pseudocode. Assume the input is always in range of 0 to 100.

```
define stars = -1

while stars is not zero

    print "How many stars do you want? "

    obtain user input and assign to stars

    define i = 0

    for i = 0 to stars-1

        print "*"

```

```
end for  
if stars is greater than 0, print "\n"  
end while
```
