

Lab-7 Ex6 - Moving average of order K

Write a program to read two positive integers, **N** and **K** ($0 < K \leq N \leq 100$), and then read another **N** integers, and output the moving average of order **K** for the **N** integers in 2 decimal places.

You may assume the input values are always valid and satisfy the constraints described above.

Input

Two positive integers, **N** and **K** ($0 < K \leq N \leq 100$), and then read another **N** integers

Output

The moving average of order **K** for the **N** integers in 2 decimal places.

Pay attention: If there are 6 numbers in the output, there will be exactly 5 spaces. **No trailing space at the end.**

Sample run #1:

8 3

1 2 3 4 5 6 7 8

2.00 3.00 4.00 5.00 6.00 7.00

Sample run #2:

5 1

5 6 2 1 0

5.00 6.00 2.00 1.00 0.00
