

Lab-9 Ex3 - Reading a File (Prelab*)

This is a PreLab exercise. Please do the PreLabs after each lecture and submit before you come to lab!

A very long file of numbers is given as **numbers.txt** of 300 lines. There are 2 integers x , y on every line. We would like to print the lines requested by the user, from `start` to `end` inclusively. The file starts on **line 1**.

In every line, the first integer x tells how many times to print the second integer y in the console output (`stdin`), e.g.,

3 10 in the file would give an output as,

10 10 10

You can assume x is always within 1 to 10, and y is always within 1 to 100. User-input numbers are ***bold and italic*** in the following sample runs.

Sample run #1

Start? ***1***

End? ***2***

75 75 75

32 32 32 32 32 32

Sample run #2

Start? ***100***

End? ***105***

11 11 11 11 11 11 11 11 11

97 97

32 32 32 32 32 32 32 32 32 32

29 29 29 29 29 29 29 29 29 29

7 7 7 7 7 7 7 7 7

92 92

Sample run #3

Start? ***300***

End? **300**

92 92 92 92 92 92 92
