

Lab-9 Ex5 - To DD:HH:MM

A duration, **D** days **H** hours **M** minutes, can be represented in a program as an array of three integers such that the first three elements correspond to **D**, **H** and **M** respectively.

For examples,

```
int P[3] = { 2, 10, 20 }; // P represents a duration of 2 days, 10
hours 20 minutes
```

```
int Q[3]; // Q represents a duration of 0 days 5 hours 6 minutes
```

```
Q[0] = 0;
```

```
Q[1] = 5;
```

```
Q[2] = 6;
```

In this problem, you do not need to implement or modify the given **main()** function.

Your objective is to implement few functions to make manipulating a duration easier.

Input: Two integers indicating the duration in minutes

Output: Print the resulting durations in the format:

Duration #1: <num of days> days <num of hours> hours <num of minutes>
minutes

Duration #2: <num of days> days <num of hours> hours <num of minutes>
minutes

Then, print the difference of two durations: The two durations are <num of
minutes> minutes apart.

Sample Run #1

1234 5678

Duration #1: 0 days 20 hours 34 minutes

Duration #2: 3 days 22 hours 38 minutes

The two durations are 4444 minutes apart.

Sample Run #2

10 0

Duration #1: 0 days 0 hours 10 minutes

Duration #2: 0 days 0 hours 0 minutes

The two durations are 10 minutes apart.
